## DRV Example

The pdf for $X$ (both $X_{1}$ and $X_{2}$ has the same distribution):

| $x$ | 1 | 2 | 3 | 4 | 5 | 6 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| $P(X=x)$ | $\frac{1}{6}$ | $\frac{1}{6}$ | $\frac{1}{6}$ | $\frac{1}{6}$ | $\frac{1}{6}$ | $\frac{1}{6}$ |

Now $W=\left|X_{1}-X_{2}\right|$. What is the meaning of $\left|X_{1}-X_{2}\right|$ ? It means that we take a random number for $x_{1}$, for example, $x_{1}=3$, and a randomly number for $x_{2}$, for example, $x_{2}=5$. Then $w=\left|x_{1}-x_{2}\right|=2$. This is associated with a certain probability ( $\frac{1}{36}$ for this example). To work out the probabilities for $W$, a table of outcomes is useful.

|  | 1 | 2 | 3 | 4 | 5 | 6 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | 0 | 1 | 2 | 3 | 4 | 5 |
| 2 | 1 | 0 | 1 | 2 | 3 | 4 |
| 3 | 2 | 1 | 0 | 1 | 2 | 3 |
| 4 | 3 | 2 | 1 | 0 | 1 | 2 |
| 5 | 4 | 3 | 2 | 1 | 0 | 1 |
| 6 | 5 | 4 | 3 | 2 | 1 | 0 |

This gives us the following pdf for $W$ :

| $w$ | 0 | 1 | 2 | 3 | 4 | 5 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| $P(W=w)$ | $\frac{6}{36}$ | $\frac{10}{36}$ | $\frac{8}{36}$ | $\frac{6}{36}$ | $\frac{4}{36}$ | $\frac{2}{36}$ |

Now try finding $E(W)$.
Next we have $Q=X_{1}-X_{2}$. This is similar to $W$, except that, without a modulus, $Q$ can take negative numbers. Let's try to find the pdf for $Q$ :

| $q$ | -5 | -4 | $\ldots$ | 4 | 5 |
| :--- | :---: | :---: | :---: | :---: | :---: |
| $P(Q=q)$ | $\frac{1}{36}$ | $\frac{2}{36}$ | $\ldots$ | $\frac{2}{36}$ | $\frac{1}{36}$ |

Let's find $E\left(Q^{2}\right), E\left(W^{2}\right), \operatorname{Var}(Q)$ and $\operatorname{Var}(W)$ to answer the questions.

## Answers

(ii) $E(W)=\frac{35}{18}$.
(iii) $E\left(W^{2}\right)=\frac{35}{6}=E\left(Q^{2}\right)$.
(iv) Since $E(W)=\frac{35}{18}$ and $E(Q)=0, \operatorname{Var}(W)=\frac{665}{324} \neq \frac{35}{6}=\operatorname{Var}(Q)$.
