### 5.1 Equations of tangents

- Step 1: differentiate given equation to find $\frac{\mathrm{d} y}{\mathrm{~d} x}$.
- Step 2: figure out what the $x$ and $y$ coordinates of the point is.
- Step 3: find the gradient of the tangent, $m$, by substituting $x$ into $\frac{\mathrm{d} y}{\mathrm{~d} x}$.
- Step 4: Use the formula $y-y_{1}=m\left(x-x_{1}\right)$ where the point is $\left(x_{1}, y_{1}\right)$.
- Step 5: Rearrange to make $y$ the subject.

### 5.2 Increasing/decreasing functions

- A curve is increasing if $\frac{\mathrm{d} y}{\mathrm{~d} x}>0$.
- A curve is decreasing if $\frac{\mathrm{d} y}{\mathrm{~d} x}<0$.

### 5.3 Stationary/maximum/minimum points

- Step 1: differentiate the given equation to find $\frac{\mathrm{d} y}{\mathrm{~d} x}$.
- Step 2: at stationary/maximum,minimum points, $\frac{\mathrm{d} y}{\mathrm{~d} x}=0$.
- Step 3: solve for $x$.
- Step 4: answer the question (do they want $x$ ? Coordinates?)
- Step 5: for maximum/minimum points, we have to test for the nature (refer to next subsection).
5.3.1 Testing for nature of stationary points: Method 1 (first order test)

| $x$ | $a^{-}$ | $a$ | $a^{+}$ |
| :---: | :---: | :---: | :---: |
| $\frac{\mathrm{d} y}{\mathrm{~d} x}$ | $<0$ | 0 | $>0$ |
| Shape | $\searrow$ | - | $\nearrow$ |

Minimum point

| $x$ | $a^{-}$ | $a$ | $a^{+}$ |
| :---: | :---: | :---: | :---: |
| $\frac{\mathrm{d} y}{\mathrm{~d} x}$ | $>0$ | 0 | $>0$ |
| Shape | $/$ | - | $/$ |

Stationary point of inflexion

| $x$ | $a^{-}$ | $a$ | $a^{+}$ |
| :---: | :---: | :---: | :---: |
| $\frac{\mathrm{d} y}{\mathrm{~d} x}$ | $>0$ | 0 | $<0$ |
| Shape | $\nearrow$ | - | $\searrow$ |

Maximum

### 5.3.2 Testing for nature of stationary points: Method 2 (second order test)

- Differentiate one more time to get $\frac{\mathrm{d}^{2} y}{\mathrm{~d} x^{2}}$.
- Sub in our value of $x$.
- If $\frac{\mathrm{d}^{2} y}{\mathrm{~d} x^{2}}>0$, we have a minimum.
- If $\frac{\mathrm{d}^{2} y}{\mathrm{~d} x^{2}}<0$, we have a maximum.
- If $\frac{\mathrm{d}^{2} y}{\mathrm{~d} x^{2}}=0$, no conclusion (we have to use the first order test instead).

### 5.4 Maxima/minima (problem sums)

- Step 1: To maximise/minimise $V$, for example, we find a formula for $V$ in terms of just one variable ( $x$ for example).
- Step 2: Differentiate to find $\frac{\mathrm{d} V}{\mathrm{~d} x}$.
- Step 3: $\frac{\mathrm{d} V}{\mathrm{~d} x}=0$.
- Step 4: Solve for $x$.
- Step 5: Answer the question (do we want $x$ ? $V$ ? $A$ ?)
- Step 6: Test that it is indeed a maximum/minimum.

### 5.5 Rates of change

- The rate of change of $V$ is given by $\frac{\mathrm{d} V}{\mathrm{~d} t}$.
- If $\frac{\mathrm{d} V}{\mathrm{~d} t}>0, V$ is increasing. If $\frac{\mathrm{d} V}{\mathrm{~d} t}<0, V$ is decreasing.
- Step 1: Find a formula for $V$ in terms of just one variable ( $x$ for example).
- Step 2: Differentiate to find $\frac{\mathrm{d} V}{\mathrm{~d} x}$.
- Step 3: Use the chain rule equation: $\frac{\mathrm{d} V}{\mathrm{~d} t}=\frac{\mathrm{d} V}{\mathrm{~d} x} \times \frac{\mathrm{d} x}{\mathrm{~d} t}$.
- Step 4: Sub in given values and answer the question.
